

1. The first step is to identify the key components of the system. This includes understanding the hardware, software, and data involved.

2. The second step is to define the requirements. This involves determining what the system is intended to do and what it needs to succeed.

3. The third step is to design the system. This includes creating a detailed plan of how the system will be built and how it will be tested.

4. The fourth step is to implement the system. This involves building the system according to the design and testing it to ensure it meets the requirements.

5. The fifth step is to maintain the system. This involves monitoring the system's performance and making any necessary adjustments.

6. The sixth step is to evaluate the system. This involves assessing the system's performance against the requirements and determining if it is meeting the goals.

7. The seventh step is to document the system. This involves creating a record of the system's design, implementation, and performance.

8. The eighth step is to communicate the results. This involves sharing the findings of the evaluation with the relevant stakeholders.

9. The ninth step is to iterate. This involves using the feedback from the evaluation to make improvements to the system.

10. The tenth step is to conclude. This involves summarizing the findings of the evaluation and determining if the system is ready for deployment.
